

TEGRITY, a classroom capture recording software, is being used in the foundational science courses in the DPT curriculum, specifically Advanced Human Anatomy, Advanced Physiology, Pathophysiology, and Neuroscience. The software records the lecture simultaneously with the PowerPoint slides and other materials that are projected from the instructor's laptop. The lectures are uploaded to Blackboard and the students are able to replay the class lectures on their personal computers, iPods, or MP3 players anytime and as many times as they would like.

"I feel that Tegrity is very helpful because often times I don't get all the information the first time sitting in lecture. With Tegrity, I can go back through a lecture at my own pace...so I make sure I understand the information or write my questions down." Tiffany, 1st year DPT student

"I find it extremely helpful ... I can get all of the information I miss in class when I listen to it and I can come back at anytime to listen because it's always available. I find it to be a wonderful feature on Blackboard and I wish all of the instructors used it." Stephanie, 1st year DPT student

"It is a great service for our students.... it provides them with the opportunity to actively listen and participate in class because they know that they can finish taking notes later when they replay the lecture. Furthermore, students have the opportunity to review difficult concepts and this should help the students master the material." Physical Therapy Instructor
